## Let $f(x)=\sin (x)$

1. Plot $y=f(x)$ over the interval $[0,2 \pi]$ and use zooming to estimate

$$
\begin{array}{lll}
f^{\prime}(0), & f^{\prime}(\pi / 6), & f^{\prime}(\pi / 4) \\
f^{\prime}(\pi / 3), & f^{\prime}(\pi / 2), & f^{\prime}(\pi)
\end{array}
$$

2. Use the symmetry of the sine function and your answers from \#1 to estimate

$$
f^{\prime}(2 \pi / 3), \quad f^{\prime}(3 \pi / 4), \quad f^{\prime}(5 \pi / 6)
$$

3. Sketch a graph of $f^{\prime}$ over the interval $[0,2 \pi]$
